# INTRODUCTION

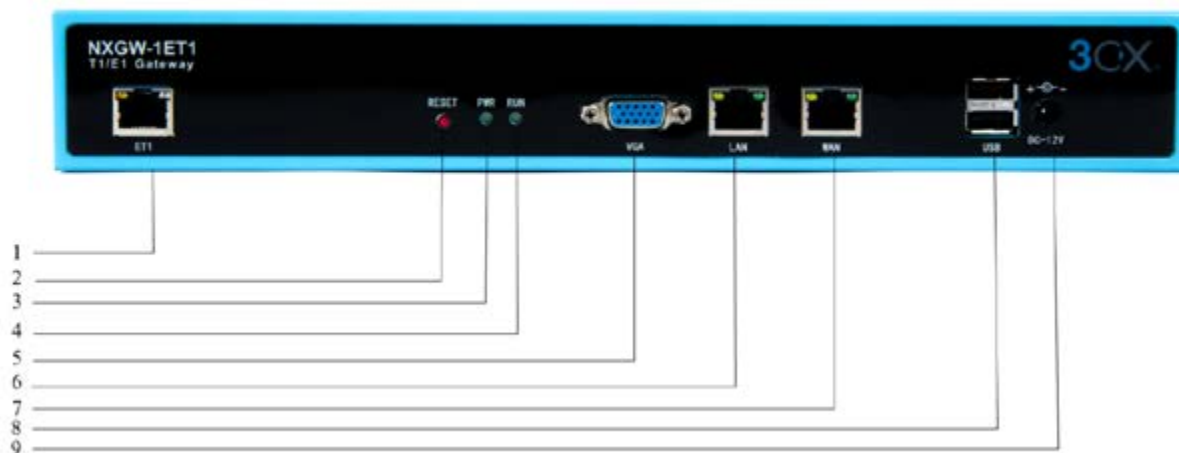

NXGW-XET1 Gateway is an open-source Asterisk-based VoIP Gateway. It is a converged media gateway product. This kind of gateway connects traditional telephone systems to IP networks and integrates VoIP PBX with the PSTN seamlessly. With a friendly GUI, users may easily set up their customized Gateway. Also, secondary development can be completed through AMI (Asterisk Management Interface).

It is developed with a wide selection of codecs and signaling protocol, including G.711A, G.711U, G.729, G.722, G.723 and GSM. It supports PRI/SS7/R2 protocol. The NXGW-XET1 Gateway has good processing ability and stability. The NXGW-XET1 gateway is 100% compatible with Asterisk, Elastix, 3CX, FreeSWITCH SIP server and VOS VoIP operating platform.

## Sample Application

## Front Panel

Interface	Function	Color	Work Status
1 Port 1-Port4	ET1 ports. There is only one port.		
2 Reset	Reset button is used to restore the device.		
3 RUN	Register indicator	Green	Slow blinking (Green 2s and Flash 0.1s): Work normally.
			Fast blinking (Green 0.5s and Flash 0.5s): Work abnormally.
			Fast blinking (Green 0.5s and Flash 0.5s): Work abnormally.
4 PWR	Power Status indicator	Green	No blinking: DAHDI Error.
			On: Power is on.
			Off: Power is off.
5 VGA	VGA monitor connector.		
6 LAN	Network interface.		
7 WAN	Network interface.		
8 USB	USB interface.		
9 DC-12V	Power supply.		

# MAIN FEATURES

- Based on Asterisk®
- Editable Asterisk® configuration file
- Wide selection of codecs and signaling protocol
- Support 512 routing rules and flexible routing settings
- Stable performance, flexible dialing, friendly GUI
- Codecs support: G.711A, G.711U, G.729, G.723, G.722, GSM
- Support ports group management
- Support call status information
- Support T.38/Pass-through fax
- Support Auto Provision, SNMP and TR069
- Connect legacy PBX systems to low-cost VoIP services
- Connect legacy PBX systems to remote sites over private VoIP links
- Connect IP PBX systems to legacy TDM services

## LOGGING IN

- Default IP: 172.16.100.1(WAN),  
192.168.100.1(LAN)
- Username: admin
- Password: admin
- Notice: Log in

# SYSTEM STATUS

Once logged in navigate to the “System Status” page. Here you will find all Interface status, channels status, SIP, IAX2, Routing rules, and Network information.

## DESCRIPTION OF SYSTEM STATUS

Options	Definition
Interface Status	Show the status of port, include “OK” and “Down”. “Down” means no trunk line connected; “OK” means the trunk line of port is available.
Channels Status	Show the Channels status of port, include “Idle”. “Busy”. “Disable” and “S channel”. “Idle” means it is available; “Busy” means the channel is busy. “Disable” means it is unavailable; “S channel” means signaling channel.

# CALL STATUS

The verbose of the system call status will be present on the "Call Status" page. You can select the specified T1/E1 port which you are care for.

Call Status						Select Port
Channel	Status	Direction	CallerID	CalleeID	AnsweredTime	Duration
1	ANSWERED	IP->PSTN	2001	2001	2016-03-10 09:39:10	00:00:40
2	ANSWERED	IP->PSTN	2002	2002	2016-03-10 09:39:10	00:00:40
3	ANSWERED	IP->PSTN	2003	2003	2016-03-10 09:39:11	00:00:39
4	ANSWERED	IP->PSTN	2004	2004	2016-03-10 09:39:11	00:00:39
5	ANSWERED	IP->PSTN	2005	2005	2016-03-10 09:39:11	00:00:39
6	ANSWERED	IP->PSTN	2006	2006	2016-03-10 09:39:12	00:00:38

15	ANSWERED	IP->PSTN	2015	2015	2016-03-10 09:39:15	00:00:35

# TIME SETTINGS

Options	Definition
System Time	Your gateway system time.
Time Zone	The world time zone. Please select the one which is the same or the closest as your city.
POSIX TZ String	Posix timezone strings.
NTP Server 1	Time server domain or hostname. For example, [0.cn.pool.ntp.org].

NTP Server 2	The first reserved NTP server. For example, [time.windows.com].
NTP Server 3	The second reserved NTP server. For example, [time.nist.gov].
Auto-Sync from NTP	Whether enable automatically synchronize from NTP server or not. ON is enable, OFF is disable this function.
Sync from NTP	Sync time from NTP server.
Sync from Client	Sync time from local machine.

## Example Time Settings

Time Settings

System Time:	2016-3-9 16:25:18
Time Zone:	Shanghai
POSIX TZ String:	CST-8
NTP Server 1:	0.cn.pool.ntp.org
NTP Server 2:	time.nist.gov
NTP Server 3:	time.windows.com
Auto-Sync from NTP:	ON

Sync from NTP
Sync from Client

You can set your gateway time Sync from NTP or Sync from Client by pressing different buttons.

## LOGIN SETTINGS

Your gateway doesn't have administration role. All you can do here is reset a new username and password to manage your gateway. You can modify "Web Login Settings" and "SSH Login Settings". If you have changed these settings, you don't need to logout, simply re-enter your new username and password. Also, you can specify the web server port number. Usually, the web login default mode is "http and https". For safety purposes, you can switch to "only https" mode.

## Description of Web Login Settings

Options	Definition
User Name	Your gateway does not have administration role. All you can do here is defining the user name and password to manage your gateway. And it has all privileges to operate your gateway .User Name: Allowed characters “- _+<>&0-9a-zA-Z”.Length:1-32 characters.
Password	Allowed characters “- _+. <>&0-9a-zA-Z”. Length: 4-32 characters.
Confirm Password	Please input the same password as ‘Password’ above.
Login Mode	Specify the web login mode: http and https, only https. Default is http and https.
Port	Specify the web server port number. Do not use port 443 which is reserved for HTTPS.

## Login Settings

Web Login Settings

User Name:	<input type="text" value="admin"/>
Password:	<input type="password" value="....."/>
Confirm Password:	<input type="password" value="....."/>
Login Mode:	<input type="text" value="http and https"/>
HTTP Port:	<input type="text" value="80"/>
HTTPS Port:	<input type="text" value="443"/>

SSH Login Settings

Enable:	<input checked="" type="checkbox"/> ON
User Name:	<input type="text" value="admin"/>
Password:	<input type="text" value="admin"/>
Port:	<input type="text" value="12345"/>

Notice: Whenever you make changes, do not forget to save your configuration.

# GENERAL

## Language Settings

You can select your language preference for your system. If you want to change the language, switch on the “Advanced” option and then “Download” your current language package. After that, you can modify the package with the language you need. Upload your modified packages, “Choose File” and “Add”.

The Language Settings interface includes a title bar 'Language Settings' and several configuration rows. The first row shows 'Language:' set to 'English' with a dropdown arrow. The second row shows 'Advanced:' with an 'ON' toggle. The third row shows 'Language Debug:' with 'TURN ON' and 'TURN OFF' buttons. The fourth row shows 'Download:' with the text 'Download selected language package.' and a 'Download' button. The fifth row shows 'Delete:' with the text 'Delete selected language.' and a 'Delete' button. The sixth row shows 'Add New Language:' with a text input field containing '选择文件' and '未选择任何文件', and an 'Add' button.

## Scheduled Reboot

If this option is enabled, you can configure your gateway to reboot automatically. There are four reboot types for you to choose, “By Day, By Week, By Month and By Running Time”.

The Scheduled Reboot interface includes a title bar 'Scheduled Reboot' and four configuration rows. The first row shows 'Enable:' with an 'ON' toggle. The second row shows 'Reboot Type:' with a dropdown menu set to 'By Week'. The third row shows 'Week:' with a dropdown menu set to 'Tue'. The fourth row shows 'Time:' with 'Hour:' set to '14' and 'Minute:' set to '16', both with dropdown arrows.

# TOOLS

On the “Tools” pages, there are reboot tools, update Firmware, upload Configuration, backup Configuration and Restore Configuration toolkits.

## Reboot Tools

You can choose system reboot or Asterisk reboot separately.

The Reboot Tools interface includes a title bar 'Reboot Tools' and three main sections. The first section has the text 'Reboot the gateway and all the current calls will be dropped.' and a 'System Reboot' button. The second section has the text 'Reboot the asterisk and all the current calls will be dropped.' and an 'Asterisk Reboot' button. The third section has the text 'Update Firmware' and a 'System Update' button. A confirmation dialog box is overlaid in the center, asking 'Are you sure to reboot your gateway now? You will lose all data in memory!' with '确定' (OK) and '取消' (Cancel) buttons.

If you press “OK”, your system will reboot and all current calls will be dropped. Asterisk Reboot is the same.

## Description of reboots

Options	Definition
System Reboot	This will turn off your gateway and then turn it back on. This will drop all current calls.
Asterisk Reboot	This will restart Asterisk and drop all current calls.

## Update Firmware

We offer two types of update options. You can choose System Update or System Online Update. System Online Update is an easier way to update your system.

Update Firmware

New system file: 选择文件 未选择任何文件

System Update

New system file is downloaded from official website and update system.

System Online Update

## Upload and Backup Configuration

If you want to update your system and keep your previous configuration, you must first backup your current configuration and once the update is completed upload the configuration.

Upload Configuration

New configuration file: 选择文件 未选择任何文件

File Upload

Backup Configuration

Current configuration file version: 0.02.03

Download Backup

## Restore Configuration

In the event that you need to factory reset your gateway simply click on the button as shown below and your gateway will be reset to the factory status.

Restore Configuration

This will cause all the configuration files to back to default factory values! And reboot your gateway once it finishes.

Factory Reset

## System Information

On the "Information" page, you will find basic information about the T1/E1 gateway. You can see the software and hardware version, storage usage, memory usage and some help information.

Model Name:	NXGW-KET1
Firmware Version:	2.5.3
Firmware Build:	1907
Hardware Version:	1.1
Port Amount:	4
Storage Usage:	100.2M/193.5M (50%)
Memory Usage:	11.107 % <a href="#">Memory Clean</a>
Kernel Build Time:	2019-Jul-2-17:10:59
Contact Address:	
Tel:	
Fax:	
E-Mail:	
Web site:	
System Time:	2019-7-11 12:22:21
System Uptime:	7 days 18:16:14

## T1/E1

### General Settings

General	
Locale:	United States ▼
Interface Type:	<input type="radio"/> T1 <input checked="" type="radio"/> E1
Span Default Law:	Auto ▼

Options	Definition
Locale	Your locale. This will be used for the tone style. Used when in-call indications need to be generated such as ring back, busy, congestion, and other call-oriented inband tone signals.
Interface Type	It shows you the current type of port. It has two type: E1 and T1.

## Advanced interface type

▼ Advanced: Interface Type

Echo Cancellation:	<input checked="" type="checkbox"/> ON
RX Gain:	<input type="text" value="0"/>
TX Gain:	<input type="text" value="0"/>

Options	Definition
RX Gain	Gain for the RX (receive -into Asterisk) channel.Default:0.0.
TX Gain	Gain for the TX (transmit -out of Asterisk Asterisk) channel.Default:0.0.

## Port Details

Port Details

Port #	Timing Source	Interface	Framing	Coding	Line Build-out	CRC4	Signalling	Switch Type	Description
Port 1	<input type="text" value="0"/>	E1	<input type="text" value="CCS"/>	<input type="text" value="HDB3"/>	<input type="text" value="0-133 feet ( DSX-1 ) and 0 db (CSU)"/>	<input type="text" value="Off"/>	<input type="text" value="PRJ(Network side)"/>	<input type="text" value="EuroIsdn"/>	<input type="text"/>
Port 2	<input type="text" value="0"/>	E1	<input type="text" value="CCS"/>	<input type="text" value="HDB3"/>	<input type="text" value="0-133 feet ( DSX-1 ) and 0 db (CSU)"/>	<input type="text" value="Off"/>	<input type="text" value="PRJ(Network side)"/>	<input type="text" value="EuroIsdn"/>	<input type="text"/>
Port 3	<input type="text" value="0"/>	E1	<input type="text" value="CCS"/>	<input type="text" value="HDB3"/>	<input type="text" value="0-133 feet ( DSX-1 ) and 0 db (CSU)"/>	<input type="text" value="Off"/>	<input type="text" value="PRJ(Network side)"/>	<input type="text" value="EuroIsdn"/>	<input type="text"/>
Port 4	<input type="text" value="0"/>	E1	<input type="text" value="CCS"/>	<input type="text" value="HDB3"/>	<input type="text" value="0-133 feet ( DSX-1 ) and 0 db (CSU)"/>	<input type="text" value="Off"/>	<input type="text" value="PRJ(Network side)"/>	<input type="text" value="EuroIsdn"/>	<input type="text"/>

Options	Definition
Timing Source	Timing Source indicate the ports as to which should be used to recover the clock. (0 for master mode, upper for client mode, small number have higher priority).
Interface	Choose a line type for the interface.
Framing	Framing method for this interface.
Coding	Coding method for this interface.
Line Build-out	Line build-out represents the length of the cable form the port on this gateway to the next device.
CRC4	Enable cyclic redundancy checking for error checking on line. CRC-4 support is required for all network switches in Europe, but many older switches and PBXs don't support it.

Signaling	It shows you what signaling the port uses.
Switch Type	Only used for PRI.
Description	An optional description of this interface to be used for reference only.

PRI

▼ ISDN: Signaling

Block Outbound Caller ID Name:	<input type="checkbox"/> OFF
Wait for Caller ID Name:	<input checked="" type="checkbox"/> ON

Definition of Signaling

Options	Definition
Q.SIG Channel Mapping	Sets logical or physical channel mapping. In logical channel mapping, channels are mapped to 1-30. In physical channel mapping, channels are mapped to 1-15,17-31, skipping the number used for the data channel, Default is physical.
Enable Caller ID	Whether or not to use caller ID.

<b>PRI Dial Plan for Dialed Number</b>	<b>PRI Dialplan:</b> The ISDN-level Type of Number (TON) or numbering plan, used for the dialed number. Leaving this as 'unknown' (the default) works for most cases. In some very unusual circumstances, you may need to set this to; 'dynamic' or 'redundant'.
<b>PRI Dial Plan for Dialing Number</b>	<b>PRI Local Dialplan:</b> Only RARELY used for PRI (sets the calling number's numbering plan). In North America, the typical use is sending the 10 digits; caller ID number and setting the prilocaldialplan to 'national' (the default). Only VERY rarely will you need to change this.
<b>Network Specific Facility (NSF) Messages</b>	Some switches (AT&T especially) require network specific facility IE. Supported values are currently 'none', 'sdn', 'megacom', 'tollfreemgacom', 'account'.
<b>Idle Bearer Reset</b>	Whether or not to reset unused B channels.
<b>Idle Bearer Reset Period</b>	Sets the time in seconds between restart of unused B channels; defaults to 'never'.
<b>Display Send</b>	<p>Send/receive ISDN display IE options, the display options are a comma separated list of the following options:</p> <p><b>block:</b> Do not pass display text data.</p> <p><b>name_initial:</b> Use display text in SETUP/CONNECT messages as the party name.</p> <p><b>name_update:</b> Use display text in other messages (NOTIFY/FACILITY) for COLP name update.</p> <p><b>name:</b> Combined name_initial and name_update options.</p> <p><b>text:</b> Pass any unused display text data as an arbitrary display message during a call. Sent text goes out in default to 'name'.</p>
<b>Display Receive</b>	<p>Send/receive ISDN display IE options. The display options are a comma separated list of the following options:</p> <p><b>block:</b> Do not pass display text data.</p> <p><b>name_initial:</b> Use display text in SETUP/CONNECT messages as the party name.</p> <p><b>name_update:</b> Use display text in other messages (NOTIFY/FACILITY) for COLP name update.</p> <p><b>name:</b> Combined name_initial and name_update options.</p> <p><b>text:</b> Pass any unused display text data as an arbitrary display message during a call. Sent text goes out in default to 'name'.</p>
<b>Overlap Dialing</b>	Enable overlap dialing mode-sending overlap digits.

Allow Progress When Call Released	Allow inband audio (progress) when a call is DISCONNECT Ted by the end of a PRI.
Out-of-Band Indications	PRI Out of band indications. Enable this to report Busy and congestion on a PRI using out_of_band notification. Inband indication, as used by the gateway doesn't seem to work with all telcos.
Facility-based ISDN Supplementary Services	To enable transmission of facility-based ISDN supplementary services (such as caller name form CPE over facility), enable this option. Cannot be changed on a reload.
Exclusive Channel Selection	If you need to override the existing channels selection routine and force all PRI channels to be marked as exclusively selected, set this to yes. priexclusive cannot be changed on a reload.
Ignore Remote Hold Indications	If you wish to ignore remote hold indications (and use MOH that is supplied over the B channel) enable this option.
Block Outbound Caller ID Name	Enable if you need to hide just the name and the number for legacy PBX use. Only applies to PRI channels.
Wait for Caller ID Name	Support caller ID on call waiting.

## MFC/R2

MFC/R2: Signaling

Enable Caller ID:	ON
Init CAS Bit:	1101
Variant:	ITU

Options	Definition
Enable Caller ID	Whether or not to use caller ID.
Init CAS Bit	The initial position of the CAS bits.
Variant	The standard of MFCR2: ITU, ANSI and China.

## Modify R2 variant

R2 Variant									
Variant Name	CDBits	Get ANI First	Req Next DNIS	Req Next ANI	Request Category	DNIS End	ANI End	Address Complete	Actions

## General

Variant Name:	argentina
R2 Category:	national_subscriber ▼
Allow Collect Calls:	No ▼
Accept On Offer:	Yes ▼
Forced Release:	No ▼
Charge Calls:	Yes ▼
Max DNIS:	4
Max ANI:	10
Get ANI First:	Yes ▼
Immediate Accept:	No ▼
Double Answer:	No ▼
Skip Category:	No ▼
CAS NonR2 Bits:	01 ▼
CAS_R2_Bits:	11 ▼

## Description of General

Options	Definition
Variant Name	The variant name.
R2 Category	national subscriber works just fine usually.
Allow Collect Calls	Default is to block collect calls.
Accept On Offer	With this set to 'no' then the call will NOT be accepted on offered, and the call will start its execution in extensions. Conf until the channel is answered.
Forced Release	Brazil use a special signal to force the release of the line instead of the normal clear back signal.
Charge Calls	Whether or not report to the other end 'accept call with charge', when interconnecting with old PBXs this may be useful.
Max DNIS	Max amount of DNIS to ask for.
Max ANI	Max amount of ANI to ask for.
Get ANI First	Whether or not get the ANI before getting DNIS.
Immediate Accept	This feature allows to skip the use of Group B/II signals and go directly to the accepted state for incoming calls.
Double Answer	This will cause that every answer signal is changed by answer->clear back->answer, sort of flash.
Skip Category	Skip request of calling party category and ANI.
CASNonR2 Bits	Which bits are never used.
CAS_R2_Bits	Which bits will be used.

## Timer

Timer	
MF Back Cycle:	<input type="text" value="5000"/>
MF Back Resume Cycle:	<input type="text" value="150"/>
MF Fwd Safety:	<input type="text" value="30000"/>
R2 Seize:	<input type="text" value="8000"/>
R2 Answer:	<input type="text" value="60000"/>
Metering Pulse:	<input type="text" value="400"/>
R2 Double Answer:	<input type="text" value="400"/>
R2 Answer Delay:	<input type="text" value="150"/>
CAS Persistence Check:	<input type="text" value="0"/>
DTMF Start Dial:	<input type="text" value="500"/>
DTMF Detection End:	<input type="text" value="5000"/>

## Description of Timer

Options	Definition
MF Back Cycle	Max amount of time our backward MF signal can last.
MF Back Resume Cycle	Amount of time we set MF signal ON to resume the MF cycle with a MF pulse.
MF Fwd Safety	Safety FORWARD timer.
R2 Seize	How much time do we wait for a response to our seize signal.
R2 Answer	How much to wait for an answer once the call has been accepted.
Metering Pulse	Metering Pulse
R2 Double Answer	Interval between ANSWER-CLEAR BACK-ANSWER when double answer is in effect.
R2 Answer Delay	Minimum delay time between the Accept tone signal and the R2 answer signal.

<b>CAS Persistence Check</b>	<b>Time to wait for to CAS signaling before handing the new signal.</b>
<b>DTMF Start Dial</b>	<b>Safety time before starting to dial DTMF.</b>
<b>DTMF Detection End</b>	<b>Safety time to decide when to stop detecting DTMF DNIS.</b>

## Definition of SS7 Link Set Settings

Options	Definition
Name	The link set name.
Type	SS7 variant.
Enabled ST	This is used to decide whether end-of-pulsing is not used to determine when incoming address is complete.
Use Connect	This setting specifies whether to reply incoming call with CON rather than ACM and ANM.
CON Echo Cancellation	This setting will enable Echo Cancellation when 'Use Connect' is enabled.
Called Party Number Stop Flag	Add a stop flag 'F' before called number send.
Transmission Medium Requirement	Specify the bearer circuit capabilities (speech, 3.1-kHz audio, 64-Kb unrestricted, and so forth) that are needed for the call being set up.
Nature Address Indicator	The nature of address indicator field is national or subscriber(default).
Subservice	The subservice field: national, international, auto or decimal/hex value The auto means that the subservice is obtained from first received SLTM.
t35	The value and action for t35. Value is in msec, action is either st or time-out, If you use overlapped dialling dial plan, you might choose:4000,st.
User Part	The type of User Part.
Variant	Running under SS7 standard.
OPC	The point code for this SS7 signalling point.
DPC	The destination point code.
Set to Default	Set the linkset as the default linkset.
Original Called Number	Information sent in the forward direction when a call is redirected and identifies the original called party.

# VOIP

## SIP Endpoints

This page shows everything about your SIP, you can see the status of each SIP.

SIP Endpoint			
Endpoint Name	Registration	Credentials	Actions
1001	server	1001	 
Add New SIP Endpoint			

## Main Endpoint Settings

Click on the  button to add a new SIP endpoint, and if you want to modify existed endpoints, you can click the  button.

There are three kinds of registration types. You can choose Anonymous, Endpoint registers with this gateway or This gateway registers with the endpoint.

You can configure as follows:

If you set up a SIP endpoint by registration "None" to a server, then you can't register other SIP endpoints to this server. (If you add other SIP endpoints, this will cause Out-band Routes and Trunks confusion.)

## None Registration

### Edit SIP Endpoint "7001"

▼ Main Endpoint Settings

Name:	7001
User Name:	7001 <input type="checkbox"/> Anonymous
Password:	****
Registration:	None ▼
Hostname or IP Address:	172.16.8.38
Transport:	UDP ▼
NAT Traversal:	Yes ▼

▶ Advanced Registration Options

▶ Call Settings

▶ Fax Options

Save Apply Cancel

For convenience, you can register your SIP endpoint to your gateway, thus your gateway just works as a server.

## Endpoint Register with Gateway

### Edit SIP Endpoint "1001"

▼ Main Endpoint Settings

Name:	1001
User Name:	1001 <input type="checkbox"/> Anonymous
Password:	****
Registration:	Endpoint registers with this gateway ▼
Hostname or IP Address:	dynamic
Transport:	UDP ▼
NAT Traversal:	Yes ▼

▶ Advanced Registration Options

▶ Call Settings

▶ Fax Options

Save Apply Cancel

You can choose registration by "This gateway registers with the endpoint", it's the same with "None", except for the name and password.

## This Gateway Register with the Endpoint

### Add New SIP Endpoint

▼ Main Endpoint Settings

Name:	6001
User Name:	6001 <input type="checkbox"/> Anonymous
Password:	****
Registration:	This gateway registers with the endpoint ▼
Hostname or IP Address:	172.16.8.38
Transport:	UDP ▼
NAT Traversal:	Yes ▼

▶ Advanced Registration Options

▶ Call Settings

▶ Fax Options

Save Apply Cancel

## Definition of SIP Options

Options	Definition
Name	A name which is able to read by human. And it's only used for user's reference.
Username	User name the end point use to authenticate with the gateway.
Password	Password the endpoint will use to authenticate with the gateway. Allowed characters.
Registration	Whether this endpoint will register with this gateway.
Hostname or IP Address	IP address or hostname of the endpoint or 'dynamic' if the endpoint has a dynamic IP address. This will require registration. Notice: if the input here is hostname and your DNS has changed, you must reboot asterisk.
Transport	This sets the possible transport types for outgoing. Order of usage, when the respective transport protocols are enabled, is UDP, TCP, TLS. The first enabled transport type is only used for outbound messages until a Registration takes place. During the peer Registration the transport type may change to another supported type if the peer requests so.
Transmission Medium Requirement	Specify the bearer circuit capabilities (speech, 3.1-kHz audio, 64-Kb unrestricted, and so forth) that are needed for the call being set up.
NAT Traversal	Addresses NAT-related issues in incoming SIP or media sessions.

## Advanced Registration Options

Options	Definition
Authentication User	A username to use only for registration.
Register Extension	When Gateway registers as a SIP user agent to a SIP proxy (provider), calls from this provider connect to this local extension.
From User	A username to identify the gateway to this endpoint.
From Domain	A domain to identify the gateway to this endpoint.

<b>Remote Secret</b>	A password which is only used if the gateway registers to the remote side.
<b>Port</b>	The port number the gateway will connect to at this endpoint.
<b>Qualify</b>	Whether or not to check the endpoint's connection status.
<b>Qualify frequency</b> <b>Frequency</b>	How often, in seconds, to check the endpoint's connection status.
<b>Outbound Proxy</b>	A proxy to which the gateway will send all outbound signaling instead of sending signaling directly to endpoints.

## CALL SETTINGS

<b>Options</b>	<b>Definition</b>
<b>DTMF Mode</b>	Set default DTMF Mode for sending DTMF. Default: rfc2833. Other options: 'info', SIP INFO message (application/ dtmf-relay); 'Inband', Inband audio (require 64kbit codec - alaw, ulaw).
<b>Trust Remote-Party-ID</b>	Whether or not the Remote-Party-ID header should be trusted.
<b>Send Remote-Party-ID</b>	Whether or not to send the Remote-Party-ID header.
<b>Caller ID Presentation</b>	Whether or not to display Caller ID.

## ADVANCED SIGNALING SETTINGS

<b>Options</b>	<b>Definition</b>
<b>Progress Inband</b>	If we should generate in-band ringing. Always use 'never' to never use in-band signaling, Even in cases where some buggy devices might not render it. Valid values: yes, no, never. Default: never.
<b>Append user=phone to URI</b>	Whether or not to add; 'user=phone' to URIs that contain a valid phone number.

<b>Add Q.850 Reason Headers</b>	Whether or not to add Reason header and to use it if it is available.
<b>Honor SDP Version</b>	By default, the gateway will honor the session version number in SDP packets and will only modify the SDP session if the version number changes. Turn This option off to force the SDP session version number and treat all SDP data as new data. This is require for devices that send non-standard SDP packets (observed with Microsoft OC S).By default This option is on.
<b>Allow Transfers</b>	Whether or not to globally enable transfers. Choosing 'no' will disable all transfers (unless enable in peers or users). Default is enabled.
<b>Allow Promiscuous Redirects</b>	Whether or not to allow 302 or REDIR to non-local SIP address. Note that promiscredir when redirects are made to the local system will cause loops since this gateway is incapable of performing a 'hairpin' call.
<b>Max Forwards</b>	Setting for the SIP Max-Forwards header (loop prevention).
<b>Send TRYING on REGISTER</b>	Send 100 Trying when the endpoint registers.

## ADVANCED TIMER SETTINGS

<b>Options</b>	<b>Definition</b>
<b>Default T1 Timer</b>	This timer is used primarily in INVITE transactions. The default for Timer T1 is 500ms or the measured run-trip time between the gateway and the device if you have qualify=yes for the device.
<b>Call Setup Timer</b>	If a provisional response is not received in this amount of time, the call will auto-congest. Defaults to 64 times the default T1 timer.
<b>Session Timers</b>	Session-Timers feature operates in the following three modes: originate, Request and run session-timers always; accept, run session-timers only when requested by other UA; refuse, do not run session timers in any case.
<b>Minimum Session Refresh Interval</b>	Minimum session refresh interval in seconds. Default is 90secs.
<b>Maximum Session Refresh Interval</b>	Maximum session refresh interval in seconds. Defaults to 1800s.
<b>Session Refresher</b>	The session refresher, uac or uas. Defaults to uas.

# FAX OPTIONS

Options	Definition
Mode	Working mode T.38 and T.30.
Enabled	Enabled
Error Correction	Error Correction
Max Datagram	<p>In some cases,T.38 endpoints will provide a T38FaxMxDatagram value (during T.38 setup) that is based on an incorrect interpretation of the T.38 recommendation, and result in failures because Asterisk does not believe it can send T.38 packets of a reasonable size to that endpoint (Cisco media gateway are one example of this situation).In these cases, during a T.38 call you will see warning messages on The console/in the logs from the Asterisk UDPTL stack complaining about lack of buffer space to send T.38FaxMaxDatagram value specified by the other end[point, and use a configured value instead.</p>
Fax Detect	FAX detection will cause the SIP channel to jump to the 'faX' extension (if exists) based one or more events being detected. The events that can be detected are an incoming CNG tone or an incoming T.38 re-INVITE request.
Fax Activity	Activate T38 fax gateway with 'timeout' seconds.
Fax Timeout	Activate T38 fax gateway with 'timeout' seconds.

# IAX2 ENDPOINT

IAX2 Endpoint			
Endpoint Name	Registration	Credentials	Actions
9001	none	9001@172.16.8.183	 
9002	none	9002@172.16.8.183	 
9003	none	9003@172.16.8.181	 
Add New IAX2 Endpoint			

You can click  button as shown above.

Save Apply Cancel

## Definition of IAX2 Endpoint

Options	Definition
Name	A name which is able to read by human. And it's only used for user's reference.
User name	User name the endpoint will use to authenticate with the gateway.
Password	Password the endpoint will use to authenticate with gateway. Allowed characters.

Registration	Whether this endpoint will register to this gateway or this gateway to the endpoint.
Hostname or IP Address	IP address or hostname of the endpoint or 'dynamic' if the endpoint has a dynamic IP address. This will require registration. Notice: If the input here is hostname and your DNS has changed, you must reboot asterisk.
Auth	Authentication method for connections.
Transfer	Disable or not IAX2 native transfer.
Trunk	Use IAX2 trunking with this host.
Qualify	Whether or not to check the endpoint's connection status.
Qualify Smothing	Use an average of the last two PONG result to reduce falsely detected LAGGED host. The default is 'no'.
Qualify Freq Ok	How frequently to ping the peer when everything seems to be OK, in milliseconds.
Qualify Freq not Ok	How frequently to ping the peer when it's either; LAGGED or UNAVAILABLE, in milliseconds.
Port	The port number the gateway will connect to at this endpoint.
Encryption	Enable IAX2 encryption. The default is no.
Force Encryption	Defaults to 128000 bytes, which supports up to 800; calls of ulaw at 20ms a frame.
Trunk MTU	With a large amount of traffic on IAX2 trunk, there is a risk of bad voice quality when allowing the Linux system to handle fragmentation of UDP packets. Depending on the size of each payload, allowing the OS to handle fragmentation may not be very efficient. This setting sets the maximum transmission unit for AIX2 UDP trunking. The default is 1240 bytes which means if a trunk's payload is over 1240 bytes for every 20ms it will be broken into multiple 1240 bytes messages. Zero disables this functionality and let's the OS handle fragmentation.
Trunk Frequency	How frequently to send trunk msgs (in ms). This is 20ms by default.

Trunk Time Stamps	Should we send timestamps for the individual sub_frames within trunk frames? There is a small bandwidth use for these (less than 1kbps/call), but they ensure that frame timestamps get sent end-to-end properly. If both ends of all your trunks go directly to TDM, _and_ your trunkfreq equals the frame length for your codecs, you can probably suppress these. The receiver must also need to have it enabled.
Min. RegExpire	Minimum amounts of time that IAX2 peers can request as a registration interval (in seconds).
Max. RegExpire	Maximum amounts of time that IAX2 peers can request as a registration expiration interval (in seconds).

## ADVANCED SIP SETTINGS

Options	Definition
UDP Bind Port	Choose a port on which to listen for UDP traffic.
Enable TCP	Enable server for incoming TCP connection (default is no).
TCP Bind Port	Choose a port on which to listen for TCP traffic.
TCP Authentication Timeout	The maximum number of seconds a client has to authenticate. If the client does not authenticate before this timeout expires, the client will be disconnected. (default value is: 30 seconds).
TCP Authentication Limit	The maximum number of unauthenticated sessions that will be allowed to connect at any given time (default is: 50).
Enable Hostname Lookup	Enable DNS SRV lookups on outbound calls Note: the gateway only uses the first host in SRV records Disabling DNS SRV lookups disables the ability to place SIP calls based on domain names to some other SIP users on the Internet specifying a port in a SIP peer definition or when dialing outbound calls with suppress SRV lookups for that peer or call.

# ADVANCED NAT SETTINGS

Options	Definition
Local Network	Format:192.168.0.0/255.255.0.0 or 172.16.0.0/12. A list of IP address or IP ranges which are located inside a NATed network. This gateway will replace the internal IP address in SIP and SDP messages with the external IP address when a NAT exists between the gateway and other endpoints.
Local Network List	Local IP address list that you added.
Subscribe Network Change Event	Through the use of the test_stun_monitor module, the gateway has the ability to detect when the perceived external network address has changed. When the stun_monitor is installed and configured, chan_sip will renew all outbound registrations when the monitor detects any sort of network change has occurred. By default this option is enabled, but only takes effect once res_stun_monitor is configured. If res_stun_monitor is enabled and you wish to not generate all outbound registrations on a network change, use the option below to disable this feature.
Match External Address Locally	Only substitute the exexternaddr or externhost setting if it matches.
Dynamic Exclude Static	Disallow all dynamic hosts from registering as any IP address used for statically defined hosts. This helps avoid the configuration error of allowing your users to register at the same address as a SIP provide.
Externally Mapped TCP Port	The externally mapped TCP port, when the gateway is behind a static NAT or PAI.
External Address	The external address (and optional TCP port) of the NAT. External address=hostname [:port] specifies a static address[:port] to be used in SIP and SDP messages. Examples: External address=12.34.56.78 External address=12.34.56.78.9900.
External Hostname	The external hostname (and optional TCP port) of the NAT. External Hostname=hostname[:port] is similar to "External address". Examples: External Hostname=foo.dyndns.net
Hostname Refresh Interval	How often to perform a hostname lookup. This can be useful when your NAT device lets you choose the port mapping, but the IP address is dynamic. Beware you might suffer from service disruption when the name server resolution fails.

## ADVANCED RTP SETTINGS

Options	Definition
Start of RTP Port Range	Start of range of port numbers to be used for RTP.
End of RTP port Range	End of range of port numbers to be used for RTP.

## PARSING AND COMPATIBILITY

Options	Definition
Strict RFC	Check header tags, character conversion in URIs, and multiline headers for strict SIP compatibility (default is yes).
Send Compact	Send compact SIP headers.
SDP Owner	Allows you to change the username filed in the SDP owner string. This filed MUST NOT contain spaces.
Disallowed SIP Methods	<p>When a dialog is started with another SIP endpoint, the other endpoint should include an Allow header telling us what SIP methods the endpoint implements. However, some endpoint either do not include an Allow header or lie about what methods they implement. In the former case, the gateway makes the assumption that the endpoint support all known SIP methods. If you know that your SIP endpoint does not provide support for a specific method, then you may provide a list of methods that your endpoint does not implement in the disallowed_methods option. Note that if your endpoint is truthful with its Allow header, then there is need to set this option.</p>
Shrink Caller ID	<p>The shrinkcallerid function removes '(', ' ', ')', non-trailing '.', and '-' not in square brackets. For example, the caller id value 555.5555 becomes 5555555 when this option is enabled. Disabling this option results in no modification of the caller id value, which is necessary when the caller id represents something that must be preserved. By default, this option is on.</p>
Maximum Registration	Maximum allowed time of incoming registrations and subscriptions (seconds).

Minimum Registration Expiry	Minimum length of registrations/subscriptions (default 60).
Default	Default length of incoming/outgoing registration.
Registration Timeout	How often, in seconds, to retry registration calls. Default 20 seconds.
Number of Registration	Number of registrations attempts before we give up. 0=continue forever, hammering the other server until it accepts the registration. Default is 0 tries, continue forever.

## SECURITY

Options	Definition
Match Auth	If available, match user entry using the 'username' field from the authentication line instead of the 'from' field.
Realm	Realm for digest authentication. Realms MUST be globally unique according to RFC 3261. Set this to your host name or domain name.
Use Domain as Realm	Use the domain from the SIP Domains setting as the realm. In this case, the realm will be based on the request 'to' or 'from' header and should match one of the domain. Otherwise, the configured 'realm' value will be used.
Always Auth Reject	When an incoming INVITE or REGISTER is to be rejected, for any reason, always reject with an identical response equivalent to valid username and invalid password/hash instead of letting the requester know whether there was a matching user or peer for their request. This reduces the ability of an attacker to scan for valid SIP usernames. This option is set to 'yes' by default.
Authenticate Options Requests	Enabling this option will authenticate OPTIONS requests just like INVITE requests are. By default this option is disabled.
Allow Guest Calling	Allow or reject guest calls (default is yes, to allow). If your gateway is connected to the Internet and you allow guest calls, you want to check which services you offer everyone out there, by enabling them in the default context.

# MEDIA

Options	Definition
TOS for SIP Packets	Sets type of service for SIP packets.
TOS for RTP Packets	Sets type of service for RTP packets.

## CODEC SETTINGS

Select codecs from the list below.

▼ Codec Settings

Codec Priority 1:	G.711 u-law ▼
Codec Priority 2:	G.711 a-law ▼
Codec Priority 3:	GSM ▼
Codec Priority 4:	G.722 ▼
Codec Priority 5:	G.723 ▼
Codec Priority 6:	G.729 ▼

### Advanced IAX2 Settings

Options	Definition
Bind Port	Bind port and bindaddr may be specified.
Enable IAXCompat	More than once to bind to multiple addresses, but the first will be the default.
Enable No Checksums	Set iaxcompat to yes if you plan to use layered switches or some other scenario which may cause some delay when doing a lookup in the dialplan. It incurs a small performance hit to enable it. This option cause Asterisk to spawn a separate thread when it receives an IAX DPREQ (Dialplan Request) instead of blocking while it waits for a response.
Enable Delay Reject	Disable UDP checksums (if no checksums is set, then no checksums will be calculated/checked on system supporting the feature).

<b>Authenticate Options Requests</b>	Enabling this option will authenticate OPTIONS requests just like INVITE requests are. By default this option is disabled.
<b>ADSI</b>	ADSI (Analog Display Services Interface) can be enable if you have (or may have) ADSI compatible CPE equipment.
<b>SRV Lookup</b>	Whether or not to perform an SRV lookup on outbound calls.
<b>AMA Flags</b>	You may specify a global default AMA flag for iaxtel calls. These flags are used in the generation of call detail records.
<b>Auto Kill</b>	If we don't get ACK to our NEW within 2000ms, and autokill is set to yes, then we cancel the whole thing (that's enough time for one retransmission only ). This is used to keep things from stalling for a long time for a host that is not available for bad connections.
<b>Language</b>	You may specify a global default language for users. This can be specified also on a per-user basis. If omitted, will fallback to English(en).
<b>Account Code</b>	You may specify a default account for Call Detail Records (CDRs) in addition specifying on a per-user basis.

### Instruction of Music on Hold

<b>Options</b>	<b>Definition</b>
<b>Mohsuggest</b>	The 'Mohsuggest' option specifies which music on hold class to suggest to the peer channel when this channel place the peer on hold. It may be specified globally or on a per-user or per-peer basis.
<b>Mohinterpret</b>	You may specify a global default language for users. This can be specified also on a per-user basis. If omitted, will fall back to English(en).

## Instruction of Codec Settings

Options	Definition
Band Width	Specify bandwidth of low, medium, or high to control which codes are used in general.
Disallow	Fine tune codes here using “allow” and “disallow” clause with specific codes.
Allow	Fine tune codes here using “allow” and “disallow” clause with specific codes.
Codec Priority	Codec priority controls the codec negotiation of an inbound IAX2 call. This option is inherited to all user entity separately which will override the setting in general.

## Instruction of Jitter Buffer

Options	Definition
Jitter Buffer	Global default as to whether you want the jitter buffer at all.
Force Jitter Buffer	In the ideal world, when we bridge VoIP channels we don't want to jitter buffering on the switch, since the endpoints can each handle this. However, some endpoints may have poor jitter buffers themselves, so this option will force to always jitter buffer, even in this case.
Max Jitter Buffers	A maximum size for the jitter buffer.
Resyncthreshold	When the jitter buffer notices a significant change in delay that continue over a few frames, it will resync, assuming that the change in delay was caused by a timestamping mix-up. The threshold for noticing a change in delay is measured as twice the measured jitter plus this resync threshold.
Max Jitter Interps	The maximum number of interpolations frames the jitter buffer should return in a row. Since some clients do not send CNG/DTX frames to indicate silence, the jitter buffer will assume silence has begun after returning these many interpolations. This prevents interpolating throughout a long silence.
Jitter Target Extra	Number of milliseconds by which the new jitter buffer will pad its size. The default is 40, so without modification, the new jitter buffer will set its size to the jitter value may help if your network normally has low jitter, but occasionally has spikes.

## Instruction of Misc Settings

Options	Definition
IAX Thread Count	Establishes the number of iax helper thread to handle I/O.
IAX Max Thread Count	Establishes the number of extra dynamic threads that may be spawned to handle I/O.
Max Call Number	The 'maxcallnumbers' option limits the amount of call numbers allowed for each individual remote IP address. Once an IP address reaches its call number limit, no more new connections are allowed until the previous ones close. This option can be used in a peer definition as well, but only takes effect for the IP of a dynamic peer after it completes registration.
MaxCallNumbers_Nonvalidated	The 'maxcallnumbers-nonvalidated' is used to set the combined number of call numbers that can be allocated for connections where call token validation has been disabled. Unlike the 'maxcallnumbers' option, this limit is not separate for each individual IP address. Any connection resulting in a non-call token validated call number being allocated contributes to this limit. For use cases, see the call should be sufficient in most cases.

## Instruction of Quality of Service

Options	Definition
Tos	Type of service
Cos	Class of service

## ADVANCED FAX SETTINGS

Options	Definition
Udptl Start	DPTL start configure addresses.
Udptl End	DPTL end configure addresses.
Udptl Checksums	Whether to enable or disable UDP checksums on UDPTL traffic.

<b>Udptl FEC Entries</b>	<b>The number of error correction entries in a UDPTL packet.</b>
<b>Udptl FEC Span</b>	<b>The span over which parity is calculated for FEC in a UDPTL packet.</b>
<b>Use Even Ports</b>	<b>Some VoIP providers will only accept an offer with an even-numbered UDPTL port. Set this option so that Asterisk will only attempt to use even-numbered ports when negotiating T.38. Default is no.</b>
<b>Maximum Transmission Rate</b>	<b>Maximum Transmission Rate.</b>
<b>Minimum Transmission Rate</b>	<b>Minimum Transmission Rate.</b>
<b>Send Progress/Status events to manager session</b>	<b>Manager events with 'call' class permissions will receive events indicating the steps to initiate a fax session. Fax completion events are always sent to manager sessions with 'call' class permissions, regardless of the value of this option.</b>
<b>Modem Capabilities</b>	<b>Set this value to modify the default modem options. Defasult:v17,v27,v29.</b>
<b>ECM</b>	<b>Enable/disable T.30 ECM(error correction mode) by default.</b>

## ROUTING

The gateway offers flexible and friendly routing settings. It supports up to 512 routing rules and about 100 pairs of calleeID/callerID manipulations can be set in a rule. It supports DID function (The usage of DID function: How to use DID function with NXGW-XET1 Gateway). The gateway support trunk group and trunk priority management.

### Call Routing Rule

Move	Order	Rule Name	From	To	Rules	Actions
	1	6001to540	iax-6001	sip-540	Callee_Dial_pattern + D (-+)  Caller_Dial_pattern + D (-+)	 
	2	iaxtoports	iax-6001	grp-ports	Callee_Dial_pattern + D (-+)  Caller_Dial_pattern + D (-+)	 
	3	6001toport	sip-7001	grp-ports	Callee_Dial_pattern + D (-+)  Caller_Dial_pattern + D (-+)	 

[New Call Routing Rule](#) [Save Orders](#)

To set up new routing rule click on  , and after setting routing rules, move rules' order by pulling up and down, click  button to edit the routing and  to delete it. Finally, click the  button to save what you set. Rules will show current routing rules. Otherwise, you can set up unlimited routing rules.

There is an example for routing rules number conversion, it transforms calling and called number at the same time. Suppose you want eleven numbers that begin with the 159 prefix to call the eleven numbers with the 136 prefix. Calling transform delete the three numbers from left, then write number 086 as the prefix, and delete the last four numbers. Add number 0755 at the end, it will show caller name is China Telecom. Called transform adds 086 as prefix, and Change the last two numbers to 88.

### Example for routing rules number conversion

processing rules	prepend	prefix	Match pattern	Sdfr	StA	Rdfr	Caller Name
Calling Transformation	086	159	xxxxxxxx	4	0755		China telecom
Called Transformation	086	136	xxxxxxxx	2	88		N/A

### Example Setup of Routing Rule

#### Create a Call Routing Rule

Call Routing Rule

Routing Name: support

Call Comes in From: 1001

Send Call Through: Port-1

Advance Routing Rule

CalleeID/CallerID Manipulation

Callee\_Dial\_pattern: Prepend

Prefix

Match Pattern

SDfR

StA

Rdfr

Caller\_Dial\_pattern: Prepend

Prefix

Match Pattern

SDfR

StA

Rdfr

Caller Name

+ Add More Manipulation Fields

The figure above realizes that calls from "support" SIP endpoint switch you have registered will be transferred to Port-1. When "Call Comes in From" is 1001, "prepend", "prefix" and "match pattern" in "Advanced Routing Rule" are ineffective, and just "CallerID" option is available.

44

## Definition of Routing Options

Options	Definition
Routing Name	The name of this route. Should be used to describe what types of calls this route matches (for example, 'SIP2Ports' or 'Ports2SIP').
Call Comes in From	The launching point of incoming calls.
Send call Through	The destination to receive the incoming calls.

## Description of Advanced Routing Rule

Options	Definition
Dial Patterns that will use this Route	<p>A Dial Pattern is a unique set of digits that will select this route and send the call to the designated trunks. If a dialed pattern matches this route, no subsequent routes will be tried. If Time Groups are enabled, subsequent routes will be checked for matches outside of the designated time(s). Rules:</p> <p>X matches any digit from 0-9  Z matches any digit from 1-9  N matches any digit from 2-9  [1237-9] matches any digit in the brackets (example: 1,2,3,7,8,9)  . wildcard, matches one or more dialed digits</p> <p>Prepend: Digits to prepend to a successful match. If the dialed number matches the patterns specified by the subsequent columns, then this will be prepended before sending to the trunks.</p> <p>Prefix: Prefix to remove on a successful match. The dialed number is compared to this and the subsequent columns for a match. Upon a match, this prefix is removed from the dialed number before sending it to the trunks.</p> <p>Match Pattern: The dialed number will be compared against the prefix + this match pattern. Upon a match, the match pattern portion of the dialed number will be sent to the trunks.</p> <p>SDfR (Stripped Digits from Right): The number of digits to be deleted from the right end of the number. If the value of this item exceeds the length of the current number, the whole number will be deleted.</p> <p>StA (Suffix to Add): Designated information to be added to the right end of the current number.</p> <p>RDfR (Reserved Digits from Right): The number of digits to be reserved from the right end of the number. If the value of this item under the length of the current number, the whole number will be reserved.</p> <p>Caller Name: What caller name would you like to set before sending this call to the end-point.</p> <p>Sets Caller*ID data on the channel:  SIP_FROM(name),SIP_FROM(number) :  defalut:Sip From and Number  eg: When selecting SIP From, Name is Peter and Number is 402.  The From mode is: \"Peter\"&lt;sip:402@172.16.6.239;transport=UDP&gt;;tag=bd481672</p> <p>SIP_TO(name),SIP_TO(number) :  defalut: EXTEN  eg: When selecting SIP To, Name is Jason and Number is 401.  To mode is: \"Jason\"&lt;sip:401@172.16.6.239;transport=UDP&gt;</p> <p>None: Set Caller*ID number which is to be send on the channel from PBX(manipulated if it sets).</p>

<b>Forward Number</b>	<b>What destination number will you dial?</b> <b>This is very useful when you have a transfer call.</b>
<b>Failover Call Through Number</b>	<b>The gateway will attempt to send the call out each of these in the order you specify.</b>

You can create various time routes and use these time conditions to limit some specific calls.

**Time Patterns that will use this Route**

Time Patterns that will use this Route

Time to start: 00 : 00

Week Day start: Monday

Month Day start: 01

Month start: January

Time to finish: 02 : 00

Week Day finish: Thursday

Month Day finish: 31

Month finish: March

+ Add More Time Pattern Fields

If you configure like this, then from January to March, from the first day to the last day of these months, from Monday to Thursday, from 00:00 to 02:00, during this time (meet all above time conditions), all calls will follow this route. And the time will synchronize with your Sever time.

**Forward Number**

Forward Number

Forward Number

Custom Context

You can configure forward number when you have a transfer call. You can also set your custom context as you like before sending the call to the endpoint.

**Failover Call Through Number**

Failover Call Through Number

Failover Call Through Number 1:

Failover Call Through Number 2:

port 1

port 2

Add a Failover Call Through Provider

You can add one or more “Failover Call Through Numbers”.

# GROUPS

This gateway allows you to combine many Ports or SIP to groups. Then if you want to make a call, it will find an available port automatically.

## Establish Group

Routing Groups

Group Name:	ALLPORT
Type:	T1/E1 ▾
Policy:	Roundrobin ▾
Members	<div>NO. <input type="checkbox"/> All</div> <div>1 <input checked="" type="checkbox"/> Port-1</div> <div>2 <input checked="" type="checkbox"/> Port-2</div> <div>3 <input checked="" type="checkbox"/> Port-3</div> <div>4 <input checked="" type="checkbox"/> Port-4</div>

# NETWORK

In the "Network" page, there are three sub-pages, "Network Settings", "DDNS Settings", "Toolkit" and "Static Route Settings".

## Network Settings

There are two types of WAN port IP, Static and DHCP. Static is the default type, and it is 172.16.100.1. The LAN port is a fixed IP and it is 192.168.100.1.

WAN Setting

Interface:	eth0
Type:	Static ▾
MAC:	A0 98 05 01 D8 A4
Address:	172.16.100.205
Netmask:	255.255.0.0
Default Gateway:	172.16.0.1

LAN Setting

Interface:	eth1
Enable:	<input checked="" type="checkbox"/> ON
MAC:	A0 98 05 01 D8 A5
Address:	192.168.100.1
Netmask:	255.255.255.0
Default Gateway:	192.168.0.1

## Definition of WAN/LAN Settings

Interface	The name of network interface.
Type	The method to get IP. Static: manually set up your gateway IP. DHCP: automatically get IP from your local LAN.
MAC	Physical address of your network interface.
Address	The IP address of your gateway.
Network	The subnet mask of your gateway.
Default Gateway	Default gateway IP address.

## DNS SERVERS

A list of DNS IP address. This info is from your local network service provider. Note that you must restart the gateway if you changed the DNS server.

DNS Servers

DNS Server 1:	<input type="text" value="8.8.8.8"/>
DNS Server 2:	<input type="text"/>
DNS Server 3:	<input type="text"/>
DNS Server 4:	<input type="text"/>

## DDNS SETTINGS

You can set a static domain.

Static Domain Settings

IP	Domain	action
127.0.0.1	localhost.localdomain	
127.0.0.1	dgw100x	
<input type="text"/>	<input type="text"/>	

Also, you can enable or disable DDNS (dynamic domain name server).

DDNS Settings

DDNS	ON <input type="checkbox"/>
Type:	inadyn ▼
User Name:	ddnctest
Password:	ddnctest
Your domain:	test.com

## Definition of DDNS Settings

Options	Definition
DDNS	Enable/Disable DDNS (dynamic domain name server).
Type	Set the type of DDNS server.
Username	Your DDNS account's login name.
Password	Your DDNS account's password.
Your domain	The domain to which your web server will belong.

## TOOLKIT

Used to check network connectivity. Support Ping command on web GUI.

### Network Connectivity Checking

**Report**

ping -c 4 www.google.com

# ADVANCED

## Asterisk API

When you click "Enable" as shown below, this page is available.

General

Enable:	<input checked="" type="checkbox"/>
Port:	5038

Manager

Manager Name:	admin
Manager secret:	admin
Deny:	0.0.0.0/0.0.0.0
Permit:	172.16.100.110/255.255.0.0&192.168.1.0/2

Rights

System:	read: <input checked="" type="checkbox"/>	write: <input checked="" type="checkbox"/>
Call:	read: <input checked="" type="checkbox"/>	write: <input checked="" type="checkbox"/>
Log:	read: <input checked="" type="checkbox"/>	write: <input checked="" type="checkbox"/>
Verbose:	read: <input checked="" type="checkbox"/>	write: <input checked="" type="checkbox"/>

Options	Definition
Port	Network port number.
Manager Name	Name of the manager without space.
Manager secret	Password for the manager. Characters: Allowed characters “- _ + . < > & 0-9a-zA-Z”. Length: 4-32 characters.
Deny	If you want to deny many hosts or networks, use char & as separator. Example: 0.0.0.0/0.0.0.0 or 192.168.1.0/255.255.255.0&10.0.0.0/255.0.0.0.
Permit	If you want to permit many hosts or network, use char & as separator. Example: 0.0.0.0/0.0.0.0 or 192.168.1.0/255.255.255.0&10.0.0.0/255.0.0.0.
System	General information about the system and ability to run system management commands, such as Shutdown, Restart, and Reload.
Call	Information about channels and ability to set information in a running channel.
Log	Logging information. Read-only. (Defined but not yet used.)
Verbose	Verbose information. Read-only. (Defined but not yet used.)
Command	Permission to run CLI commands. Write-only.
Agent	Information about queues and agents and ability to add queue members to a queue.
User	Permission to send and receive UserEvent.
Config	Ability to read and write configuration files.
DTMF	Receive DTMF events. Read-only.
Reporting	Ability to get information about the system.
Dialplan	Receive NewExten and Var Set events. Read-only.
Originate	Permission to originate new calls. Write-only.
All	Select all or deselect all.

Once you configure as shown above, the host 172.16.100.110/255.255.0.0 is allowed to access the gateway API. Please refer to the below image to access the gateway API by putty. 172.16.100.110 is the gateway's IP, and 5038 is its API port.

```
172.16.100.110 - PuTTY
[wh@IX130 tmp]#telnet 172.16.100.110 5038
Asterisk Call Manager/1.3
action: login
username: admin
secret: admin

Response: Success
Message: Authentication accepted

Event: FullyBooted
Privilege: system,all
Status: Fully Booted
```

Asterisk CLI

In this page, you are allowed to run Asterisk commands.

Asterisk CLI

Command:

Execute

Lock / Unlock channels

Signalling:	pri	
Operation:	Lock	
Channel:		
	Execute	

Definition of Asterisk CLI

Options	Definition
Command	Type your Asterisk CLI commands here to check or debug your gateway.

If you type "help" or "?" and execute it, the page will show you the executable commands.

Definition of Lock/unlock channels

Options	Definition
Signaling	Current signaling in use.

Operation	The advanced operations for lock and unlock channels.
Channel	The channel to be lock or unlock.

# **ASTERISK FILE EDITOR**

On this page, you are allowed to edit and create configuration files. Click the file to edit.

Prime Config. Files	
File Name	File Size

<a href="#">calendar.conf</a>	5171

Click “New Configuration File” to create a new configuration file. After editing or creating, please reload Asterisk.

# **AUTO PROVISIONING**

Auto provisioning or auto-configuration is an easy, flexible and time-saving way to upgrade firmware and configurations for E1 gateways in mass deployment. With auto provisioning, all user information can be entered via the central ACS (Auto Configuration Server). ACS can be DHCP server or TFTP, HTTP and FTP server. It will not take effects immediately but during the next power on or restart of the system.

Note that system will not be upgrade the firmware and update configurations if the connection between ACS and gateway is lost.

## Preparation

The following should be prepared before auto provisioning being applied.

- Enable the auto provisioning in gateway
- The ACS has been prepared
- The network between gateway and ACS is connected

## Configuring gateway

Usually, the feature is disabled by default. To activate the auto provisioning function, please follow the procedures as below.

**Step 1 ADVANCED**-> Auto Provision interface

**Step 2** Enable the 'Enabled' option and select ACS. DHCP option 66 can be enabled if ACS has been working as DHCP server, otherwise please select protocol of provisioning and fill the value of 'Auto Config Server URL'. Username and password may need to be filled in FTP/HTTP for the purpose of system safety. Do not forget to select Firmware upgrade, upgrade mode and fill the value of timeout, and click 'Save'.

**Step 3** Set interval of checking in LOGS->System notice then enable it, and click 'Save'.

## Definition of Auto Provision

Options	Definition
Enabled	Whether to enable or disable Auto Provision.
DHCP Option 66	Get ACS server address from Option 66 via DHCP.
Protocol	Set protocol of connection.
Auto Config Server URL	The config server domain or IP address.
User Name	The account of downloading from ACS.

<b>Password</b>	The password of downloading from ACS.
<b>Timeout</b>	The max limit time for downloading firmware.
<b>Firmware Upgrade</b>	Enable/disable the mode of downloading firmware.
<b>Upgrade Mode</b>	Select upgrade time. Power: start upgrade configuration when Power on. Power + Period: Set the frequency of checking the latest configuration when gateway running.

## Definition of system notice

<b>Options</b>	<b>Definition</b>
<b>Enabled</b>	Whether to enable or disable system notice.
<b>Check Interval</b>	When Upgrade Mode is set, this parameter specifies the interval of Checking.

## Auto Provision interface

Auto Provision Settings

Enabled:	<input checked="" type="checkbox"/> ON <input type="checkbox"/> OFF
DHCP Option 66:	<input type="checkbox"/> OFF <input checked="" type="checkbox"/> ON
Protocol:	TFTP <input type="button" value="v"/>
Auto Config Server URL:	172.16.6.111 (172.168.0.X / domain.com )
User Name:	<input type="text"/>
Password:	<input type="password"/>
Timeout:	120 <input type="text"/> Sec.
Firmware Upgrade:	<input checked="" type="checkbox"/> ON <input type="checkbox"/> OFF
Upgrade Mode:	Power On + Period <input type="button" value="v"/>

Save

## Configuring ACS

The Auto Configuration Server can be the one of TFTP, FTP and HTTP server. The ACS is used to store the firmware release and configurations files of the devices under management.

List the primary files in ACS download directory as table 7-4-3:

## Definition of ACS files

Options	Definition
DGW100x-current.bin	The firmware image.
common.conf	The wildcard configuration file for the whole gateway.
defconfig.tar.gz	The default(factory) configuration file.
EPC-{mac}.conf	The private configuration file for the specified gateway. Naming rules: "EPC-" + "mac" + ".conf". The naming prefix of "EPC-" stands for the private configuration file, "mac" is the physical address of network interface card but removed semicolon and ".conf" is the suffix. For example, the EPC-a0980501dbca.conf, 'a0980501dbca' is the MAC address (A0:98:05:01:DB:CA).

The format of common.conf , EPC-{mac}.conf and defconfig.tar.gz:

(1). Common.conf

[firmware]

FW\_NAME=DGW100x-current.bin //Firmware image name

FW\_MD5=b3603f3c3b5e7eb6326498640f151c79 //The md5 of firmware image

FW\_VERSION=1.1.2 //Firmware version

[configs]

CONFIG\_NAME=defconfig.tar.gz // default configuration file(compressed)

CONFIG\_MD5KEY=2cd2dfbe52482405350816e3698cb530 // the md5 of default configuration file

(2).EPC-{mac}.conf

[dns]

DNS\_SERVER1=8.8.8.8

DNS\_SERVER2=8.8.4.4

asterisk         lighttpd        ntp.conf        syslog.conf
cron             logrotate.conf  php.ini         udhcpd.conf
dahdi            logrotate.d     redis.conf      zoneinfo
dnsmasq          network        services
[root@dgw100x /defconfig]#

```

### Provisioning example

After auto provisioning is enabled, the gateway will visit the Auto Configuration Server and download the updated files periodically based on the timer Check Interval (LOGS->System notice). By default, the timer is set as every hour. System will receive a message from ACS, and the message will be displayed in the system notice (LOGS->System Notice).

Auto provisioning will not take effect immediately but in the next time system is powered up or restarted. Now, an example of using Auto Provisioning will be given in the following.

1. Activate the auto provision (TFTP) in ADVANCED-> Auto Provision like figure 7-4-4. Figure 7-4-3 Auto provision settings

Auto Provision Settings	
Enabled:	<input checked="" type="checkbox"/> ON
DHCP Option 66:	<input type="checkbox"/> OFF
Protocol:	TFTP
Auto Config Server URL:	172.16.6.111 (172.168.0.X / domain.com )
User Name:	
Password:	
Timeout:	120 Sec
Firmware Upgrade:	<input checked="" type="checkbox"/> ON
Upgrade Mode:	Power On + Period

Save

2. Enable the check interval in LOGS->Log settings->System Notice like figure 7-4-5. Figure 7-4-4 Check interval setting

System Notice	
Enable:	<input checked="" type="checkbox"/> ON
Check Interval:	Every hour

Save

3. Configure the ACS (Generate the md5 of firmware and defconfig.tar.gz)

Copy the firmware, defconfig.tar.gz, common.conf and EPC-{mac}.conf to the working directory of TFTP server.

## The working directory of TFTP server

generate_md5_tool	2016/3/8 15:14	文件夹	
Tftpd32汉化版	2016/3/8 15:14	文件夹	
common.conf	2016/3/8 15:17	CONF 文件	1 KB
defconfig.tar.gz	2015/12/10 11:28	GZ 文件	390 KB
DGW100x-current.bin	2016/3/8 15:04	KuaiZipMount.bin	42,641 KB
EPC-a0980501dbca.conf	2015/9/22 13:25	CONF 文件	1 KB
tftpd32.chm	2015/8/31 16:50	编译的 HTML 帮...	330 KB
tftpd32.exe	2015/8/31 16:50	应用程序	211 KB
tftpd32.ini	2015/12/10 18:25	配置设置	3 KB

Notice: The demo of E1 gateway mac address is A0:98:05:01:DB:CA (eth0), therefore the private configuration file is EPC-a0980501dbca.conf.

4. Generate the md5 of firmware and defconfig.tar.gz. Then fill in common.conf and EPC-{mac}.config.

## Generate the md5 of firmware and configuration

## Common.conf

```
[root@localhost build]# cat common.conf
[firmware]
FW_NAME=DGW100x-current.bin
FW_MD5=8d8a5f5980f7bd12211bbf673f6eb193
FW_VERSION=1.1.2

[configs]
CONFIG_NAME=defconfig.tar.gz
CONFIG_MD5KEY=58d73303a5f53fbd18d213be5f3acefd
[root@localhost build]#
```

## EPC- a0980501dbca.conf

```
[root@localhost build]# cat EPC-a0980501dbca.conf

5. Start TFTP service. Tftpd32.exe is a useful TFTP tools in windows7, then make sure TFTP server is select.

## A demo TFTP server

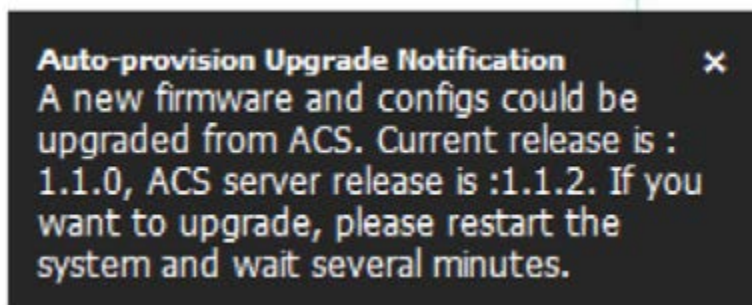

6. The system will receive an auto provision message in web GUI.

## System notice logs

Notice Logs		
Date	Subject	Content
2016/03/08 15:55:47	Auto-provision Upgrade Notification	A new firmware and configs could be upgraded from ACS. Current release is : 1.1.0, ACS server release is :1.1.2. If you want to upgrade, please restart the system and wait several minutes.
<div>Refresh Clean Up</div>		

## Auto provision upgrade notification

7. Restart the system. It will take about 3 minutes to download, upgrade Firmware and update configurations.

## Downloading the firmware and configs

```
Setting up interface lo... [ OK ]
starting SSH service ..... [ OK ]
starting Redis service ..... [ OK ]
starting SOAP service..... [ OK ]
Checking the network between TFTP server and T1/E1 Gateway, wait a moment
Info: Auto-Provision switch has been enabled
Info : Checking firmware upgrade flag... [ On ]
Auto Configuration Server URL : 172.16.6.111
Info : Checking firmware md5... [ mismatch ]
Preparing to download new fw image from 172.16.6.111.
firmware URL : 172.16.6.111
firmware name : DGH100x-current.bin
firmware download from : tftp
Download Progress: 13.5M, Time lapses: 18 Sec
```

## Applying the firmware and configs

```
Asterisk service status ..... [ Stopped ]
Info : Updating system configs .....
Info: New configs have been loaded successfully!
info : New firmware and configs to take effect , System will be restart
al seconds
```

# SNMP

Simple Network Management Protocol (SNMP) is an application-layer protocol, which is used to manage and monitor network elements and exchange management information between network devices. By default, SNMP uses port 161 for communication.

Since the inception SNMP, it embraces three versions: v1, v2c and v3. V1 and v2c are the most implemented version of SNMP; v3 is target at the high security when compare to its older versions. The gateway support private SNMP MIBs (private enterprise number) to access.

## Parameters in SNMP setting

Options	Definition
SNMP Enable	Whether to enable SNMP.
System Contact	System contact information(optional).
System Location	The locale of system contact(optional).
Private Enterprise Number	The number is used for defining private SNMP MIBs which is assigned by Internet Assigned Numbers Authority (IANA). For more information, please access: <a href="http://pen.iana.org/pen/PenApplication.page">http://pen.iana.org/pen/PenApplication.page</a> .
SNMP Version	Select version of SNMP.
Community Configuration	Define a community name to security name.
Group Configuration	Define the security name to a group.
View Configuration	Set a view to let the group have rights to do.
Access Configuration	Grant the group can access to the view(read/write/notify).
User Configuration	Only exist in v3. Add a v3 account to SNMP. Notice that the length of auth password and privacy password are more than 8.

## Activating SNMP

Usually, the feature is disabled by default. To activate the SNMP feature. Follow the image below to activate. The Interface is in the ADVANCED->SNMP. System contact, location and private enterprise number are optional. Figure 7-5-1 is the SNMP setting interface.

SNMP Parameter

SNMP Enable:	<input checked="" type="checkbox"/>
System Contact:	administrator
System Location:	ShenZhen
Private Enterprise Number(PEN):	42421
SNMP Version:	v2c

Community Configuration

Order	Security Name	Community
1	notConfigUser	public

Group Configuration

Order	Group	Security Name
1	notConfigGroup	notConfigUser

View Configuration

Order	ViewName	ViewType	ViewSubtree	ViewMask
1	all	included	.1	NA

Access Configuration v1/v2c

Order	Group	Read	Write	Notify
1	notConfigGroup	all	none	none

Save

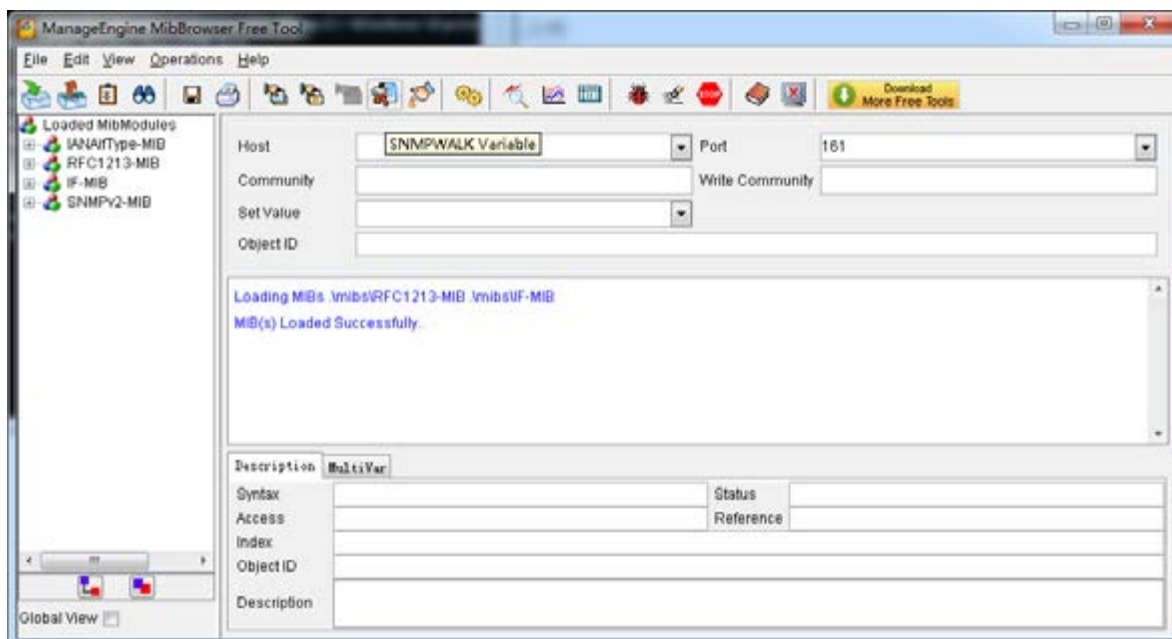

Note: Do not forget to click 'Save' after configuration, The SNMP feature is activated immediately.

## Verify SNMP

A powerful, indispensable and easy-to-use MIB browser is convenient for engineer/manager to manage SNMP enabled network devices and applications. In this session, Manage Engine MIB browser is selected. It allows user to issue SNMP requests to retrieve agent's data, or make changes to the agent. It is free tool for Windows, Mac and Linux.

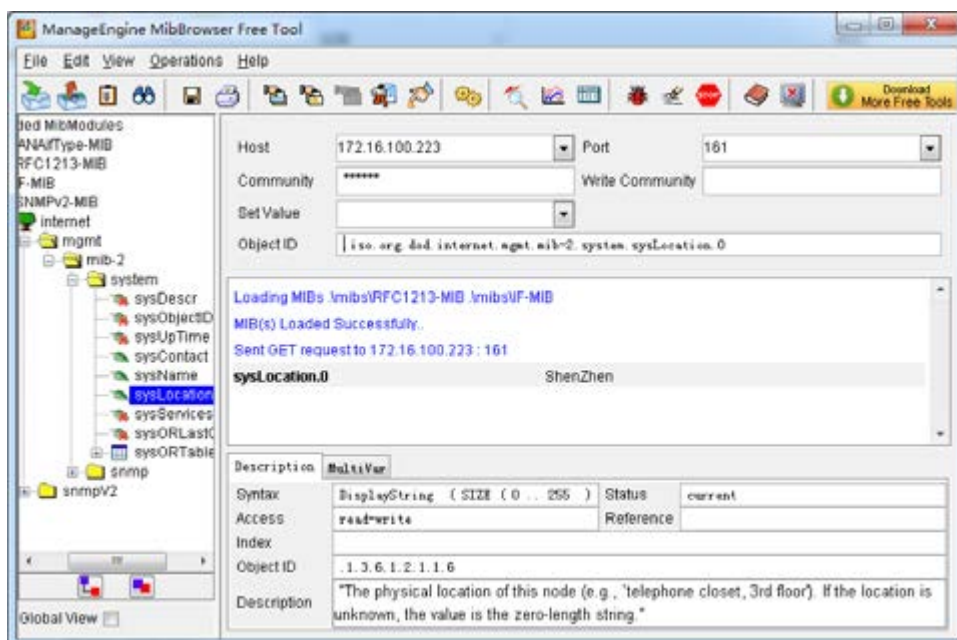

1. Get SNMP parameters via SNMP MIB browser. The Manage Engine MIB browser is installed perfectly. Below you will see the main interface of Manage Engine MIB browser.

## Manage Engine MIB browser

2. And the field of Host, Port and Community are filled with 172.16.100.223, 161 and public respectively. Object ID is the node of SNMP MIBs, e.g. ".1.3.6.1.2.1.1.6.0" is system location and ".1.3.6.1.2.1.1.1.0" is system description.

## Get system location

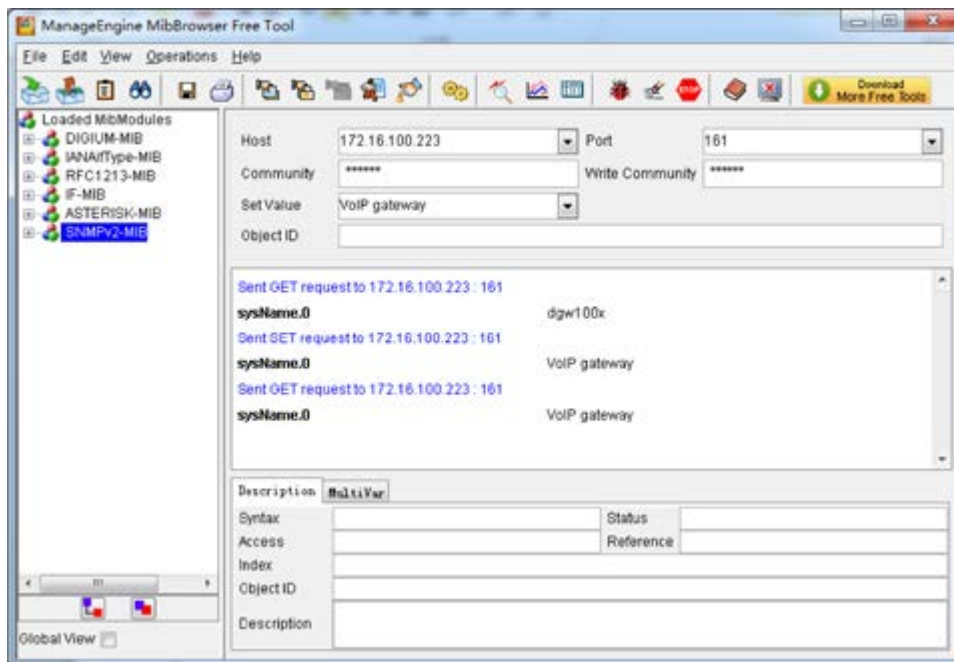

3. After the rest field has been filled, then verify it. Click Operations->GET to get the value of system location and it returns the value which we just set.

4. Set SNMP parameters via SNMP MIB browser. For example, set the system name. system name is "dgw100x" by default, then set it as "VoIP gateway". See figure 7-5-4.

- Click Operations->GET to attain the current system name.
- Fill the field of Set Value with "VoIP gateway".
- Click Operations->SET to set the system name.
- Click Operations->GET to attain the modified system name.

## Set system name

## TR069

TR069 is a remote management solution which offers a single interface to manage the ACS and automate the deployment and support of data, voice and video services, thereby reducing operation and support costs, while enhancing customer satisfaction. Its user-friendly interface covers the entire service lifecycle, from centralized remote provisioning of services, to inventory management, group updates, monitoring, event triggering, and support automation. Below is TR069 configuration interface and its definition.

Options	Definition
Acs Url	Specify the URL of the ACS
Acs Username	Specify the user name to be used by the device to authenticate with the ACS.
Acs Password	Specify the password to be used by the device to authenticate with the file server

<b>Provisioning Code</b>	Information of the device vendor, which may be used to indicate the primary service provider and other provisioning information to the ACS. It can be numbers or English letters.
<b>Model Name</b>	A brief description of the interface type or name. It is a string of characters.
<b>Periodic Enable</b>	Used to specify whether to periodically report to the ACS.
<b>Periodic Interval</b>	The interval for reporting to the ACS.
<b>Connection Request Url</b>	The address used for the ACS to connect back to the device.
<b>Connection Request Username</b>	The account used for the ACS to connect back to the device, for example, admin.
<b>Connection Request Password</b>	The password used for the network management server to connect back to the device.

TR069 Parameter

Enable:	<input checked="" type="checkbox"/> ON
Acs Url:	<input type="text" value="http://172.16.80.121"/>
Acs Username:	<input type="text" value="admin"/>
Acs Password:	<input type="text" value="admin"/>
Provisioning Code:	<input type="text"/>
Model Name:	<input type="text"/>
Periodic Enable:	<input checked="" type="checkbox"/> ON
Periodic Interval:	<input type="text" value="1800"/>
Connection Request Url:	<input type="text" value="http://172.16.100.110:7547/"/>
Connection Request Username:	<input type="text"/>
Connection Request Password:	<input type="text"/>

# NETWORK CAPTURE

The gateway has been supplied a network packet capture in the web for easy analysis, capturing and monitoring of the gateway's network status, RTP flows, protocol analysis and so on.

## Definition of Network capture

Options	Definition
Network Interface	Specify which interface to be capture packets from. 'All' means capture packets from all interfaces.
Source host	Specify which source host IP address to listen for.
Destination host	Specify which destination host IP address to listen for.
Port	To specify a port that is either source or destination direction.
Protocol	To specify which protocol to be captured, 'All' stands for capture multi-protocols, the SIP default port is 5060, If you are using a different port, please amend it.

The interface is in ADVANCED->Network Capture.

## Network capture interface

# CLOUD

NXGW-XET1 gateways support Cloud Management.

## Connecting to the Cloud

If your device is connected to the cloud management, the SSH and the web pages of the gateway can be accessed through the cloud management, and it can be monitored whether the device is connected to the cloud management platform. On the cloud management platform, you can also count your device model, quantity, distribution area, and so on which can provide you with efficient and excellent service and experience.

Cloud

# CALL STATISTICS

Here you'll find "Answered", "congestion", "Call busy", "Call failed", "No answer", "Current calls", "accumulated calls", "Calls duration" and "ASR". "ASR" stands for Answer Seizure Ratio. "Calls duration" will count all the calls in the gateway. The call statistics will be saved before power off. It will be loaded after power on. It can be refreshed by itself. You can reset the statistics manually.

Statistics

Answered	Congestion	Call Busy	Call Failed	No Answer	Unknown	Current calls	Accumulated Calls	Calls duration	ASR
57571	0	0	0	0	0	0	57571	3456781	100%

Refresh

Reset Statistics

Note: Do not forget to enable call statistics in "Log Settings".

## SYSTEM NOTICE

The system notice is generated by the system to keep the network manager informed of any firmware upgrades and auto provisioning messages from ACS. Enable the system notice function in "Log Setting" page as shown below.

**System Notice**

<b>Enable:</b>	<input checked="" type="checkbox"/> ON
<b>Check Interval:</b>	Every hour ▼

Save

After about an hour, a system message is received in the web.

Notice Logs		
Date	Subject	Content
2016/03/10 12:05:13	System Upgrade Notification	A new firmware could be downloaded from system online. Current release is : 1.0.9, OpenVox latest release is :1.1.0. If you want to upgrade, please transfer to SYSTEM->tools pages.
2016/03/10 12:05:10	Auto-provision Upgrade Notification	A new firmware and configs could be upgraded from ACS. Current release is : 1.0.9, ACS server release is :1.1.2. If you want to upgrade, please restart the system and wait several minutes.

RefreshClean Up

Note: Do not forget to enable system notice and check interval in "Log Setting" if you want to receive system messages.
